Walk-In Type Temperature (& Humidity) Chamber
E Series
New N-instrumentation produces a smart chamber
Leading eco model better than ever

The E Series walk-in type chamber is already renowned for its epoch-making power savings. Power savings achieved thanks to a wide-range refrigeration control system, an active map system, and other original control devices. Energy reduction accounts in some cases for half of the previous model consumption, due to the development of a cross output control system (patented in Japan) lowering electrical requirements of temperature & humidity operation and many other features.

Energy consumption is, more than ever, an important issue to address in our line of business. Now, the E Series capabilities are even further optimized thanks to the N-instrumentation, alloying highly-accurate controllers with user-friendly interactive input system to support easy operation and network solutions.

Dramatic reduction in power consumption, smoother airflow, etc. improved the temperature distribution and allowable heat load, and seal material has been designed to minimize unpleasant odors.

The E Series chamber has been brought to a new level of excellence.
* Equipped with options.
**System configuration**

**Test chamber variations**

- **TYPE 1**: 4.2m³ (2.0m²)
- **TYPE 2**: 8.1m³ (3.9m²)
- **TYPE 3**: 12.5m³ (5.9m²)
- **TYPE 4**: 16.8m³ (8.0m²)
- **TYPE 5**: 20.8m³ (10.1m²)
- **TYPE 6**: 25.8m³ (12.3m²)
- **TYPE 7**: 34.8m³ (16.6m²)
- **TYPE 8**: 52.7m³ (25.1m²)

**Refrigerator**

- **For Control**: 2.20kW, 3.70kW
- **For Loads**: 5.60kW, 7.46kW

**Mechanical compartment variations**

- **ACU10**, **ACU20**, **ACU30**

**Program control operation**

Characteristics

Networking communications and USB data transfer for optimum test operations

Network with new N-instrumentation
Supports chamber control from a variety of terminals

The tabbed user interface of the chamber instrumentation is designed to make operations for accessing to specific screens easier than ever. An Ethernet (LAN) port is equipped as standard, so it is possible to connect to and monitor the chamber operation conditions from a device such as a PC or tablet PC. As an option, a Web browser can be used to communicate with chambers to perform tasks such as modifying test conditions and even starting and stopping operation. Besides more, the remote communication area can be expanded by connection to an intranet (a LAN inside your company).

Security measures

Password authentication is required when accessing the USB flash drive. LAN port and/or USB port function can be terminated as required.

Interface

• Remote monitoring
• Operation* (Test pattern change, run start/stop)
• Program pattern edit and copy*
• Data management
• Email alert

*Option

Remote monitoring

A Web browser running on a computer connected to a chamber over an ethernet connection can be used to monitor chamber running conditions. Simply connect the chamber to a computer via LAN and set the IP address. No software or drivers are required.
Characteristics

- **Instrumentation panel**
  - <LAN settings>
  - <External memory (USB) settings>

- **PC screen**
  - <Chamber monitor>
  - <Edit program (USB)>

- **Program pattern edit and copy**
  - A program pattern created on a computer can be written to a chamber, and program patterns stored on a chamber can be copied to a computer via the USB interface.

- **Downloading test programs**
  - ESPEC’s web-based Tech site “Test Navi” introduces various test standards related to environmental testing. Test standards can be performed by downloading a test program to the computer connected to the chamber. A program pattern editing function enables modification of test profiles. In addition, accurate testing can be performed by using USB memory to copy data between chambers and transferring it directly to N-instrumentation.
  - *User registration is required to use the Test Navi website for engineers.
    http://www.test-navi.com/eng/index.html

  - The web-based Tech site provides practical knowledge on environmental testing that ESPEC has acquired through years of experience, as well covering everything from the fundamentals to the latest information on environmental and reliability testing.

- **Collecting chamber data**
  - Network function or USB memory can be used to retrieve chamber operation log data. Data can be opened as a list or graph thanks to a dedicated viewer or spreadsheet, and can be used to check historical data.

- **Email alert**
  - When an alarm is triggered, an email is sent to the registered PC or mobile address.
  - *Connection to a mail server is required to use e-mail alert.

  - Copying and editing data on a computer with USB memory requires installation of the Pattern Manager Lite application software that comes with the chamber.
**Characteristics**

- **Backtrace function**
  When the chamber stops because of trouble, the operation state just before the chamber stops is automatically recorded and saved. Saved data can be transferred by USB memory. Attach this data file to an email to ESPEC, and we will perform troubleshooting.

- **Online diagnostics services**
  Diagnostics service is available using the backtrace data from the time of trouble. Send the backtrace data to ESPEC via email; we will analyze the cause of the trouble and report the diagnosis back to you. This service ensures accurately-performed diagnosis so that, in the case that repair work is required, appropriate troubleshooting will be prescribed ensuring reduced testing downtime.

* Application page
  http://www.espec.co.jp/english/support/onlinediagnosticsservice.html
High-speed processing N-instrumentation and 10.4 inch color touch panel feature improved operability and legibility

- **Tabbed user interface**
  Controller’s new layout includes tabs at the bottom of the screen to easily activate any section. Calculating and processing performances have been improved, and the screen layout optimized.

- **A variety of program settings**
  The program memory has a capacity for 40 patterns (1 pattern 99 steps). The time for each step is set in 1-minute increments up to a total of 9999 hours and 59 minutes. Steps can be inserted, copied, and deleted. Created patterns can be confirmed on the screen and operation can be started from intermediate steps.

- **Sampling function**
  The temperature and humidity measurement targets, and measurement intervals can be set. The trend graph with set conditions and data are saved in the controller memory. These data can then be transferred on a USB memory.

- **Alarm function**
  If trouble occurs, the details, date, and time of occurrence are displayed on the alarm screen. The next screen shows the cause and recovery procedures.

- **Calendar timer function**
  You can automatically start and stop the chamber at the desired time. The month, day, day of the week, and time can be set with the timer.

- **Multi-lingual display**
  A simple operation changes display text to Japanese, Chinese (simplified, traditional), or Korean. Select the language that suits your needs.

An automatic control system to quickly respond to load changes

Simply by setting the temperature and humidity conditions, the automatic control system works at maximum capacity up to the setting, and then after reaching it, can maintain it at minimum capacity. It can quickly respond to door operations and changes in heat-generation loads during testing to create a constantly stable testing environment.

Improving temperature & humidity distribution performance/allowable heat load performance

By improving the fan system so air flows more smoothly, and by increasing heat exchanger efficiency, the temperature and humidity distribution has an even higher degree of precision and the allowable heat load is improved.

Two modes for even more energy savings

Selecting Eco-Mode reduces power consumption. Select the mode that suits current test conditions.

Achieves power and space savings with air conditioners optimized to performance requirements

The system can be upgraded to an optimal chamber by matching the fan motor, heater, humidifier, and refrigerator that make up the air conditioner to the test area capacity and specimen heat load. We will customize the chamber to your needs.

Saving energy – major reduction in power consumption and power equipment capacity

- **Featuring a new high precision cooling system with greatly reduced power consumption (Patent pending)**
  
  We have developed a wide-range cooling control system composed of a DC inverter that can widely and continuously vary refrigeration capacity an electronic expansion valve, as well as unique control methods such as the active map system to control the operation of multiple refrigerators at minimum power consumption. This cooling system controls output and refrigeration capacity with high precision and achieves both high performance and broad power savings.
  
  With automatic control, the system also demonstrates an even larger refrigeration capacity and quickly responds during rapid and large heat-generation loads and during sharp drops in temperature and humidity.

- **Cross-output control reduces power equipment capacity (Japanese patent number 2928162) EBE, EBL, EBR**
  
  This is a large chamber with a wide test area, so a relatively high power capacity is required. When operations start, because the heater and the humidifier operate at the same time, the maximum current flows.
  
  The cross-output control limits the maximum currents of the heater and the humidifier.
  
  It controls the currents by giving priority to the heater and adjusting the humidifier. It may take some time to reach the set temperature and humidity, but it allows reducing the maximum current and thereby reducing the power equipment capacity. In addition, this feature can also be used to prevent dew condensation through delayed operation.

- **E Series (EBL-4E)**

* Control temp & humidity conditions: +20°C/30%rh
* External temp & humidity: +23°C/50%rh
* Operating rate 0.7 x 15 yen/kWh

**Approx. 60% reduction**

- Calculated value when no load
- Yearly power fee = Calculated by Power amount x 24 hours x 365 days x
- Operating rate 0.7 x 15 yen/kWh
  - [differs by region and time period used]
The viewing window automatically prevents fogging

A heater in the viewing window door section automatically turns on according to the temperature setting and glass incorporating a heat generator is used to prevent fogging. A large viewing window option is also provided.

Continue operation with the automatic backup function when trouble occurs

If a problem occurs with a portion of the chamber, the remaining devices can be flexibly run to continue operation, making it unnecessary to stop the test. If the humidifier breaks, the system will also switch to temperature operation.

Employs a steam humidification system with good humidifying efficiency

Impurities adhere with difficulty in the externally installed steam humidification system because of automatic cleaning operations by exchanging the humidifying water. The cleaning period is announced through the instrumentation screen and cleaning is also performed outside the chamber.

We deliver custom-made chambers

We will meet your demands to change chamber performance according to the content of tests and other requirements.

New features – Enhanced testing accuracy

- **All-weather LED lights (Patent pending)**

  These LED lights now illuminate in the entire temperature and humidity control range. Allying energy savings, long life, and excellent responsiveness when turned on, LED lights bring brightness (approx. 2.5x), and power consumption is reduced of approx. 1/5th compared to conventional incandescent lights illuminating the chamber.

- **Reduced odors/siloxanes**

  A new seal material that reduced low-molecular siloxanes is used in the panel connections. This not only prevents any effect on the specimen from contact faults by siloxanes in the chamber, but also greatly reduces irritating odors from the seal material.

- **Noise level in test area reduced of 10 dB (Traditional machine comparison: Mechanical compartment ACU10)**

  The air conditioning compartment's smooth air flow not only increases temperature and humidity distribution performance, it also decreases the occurrence of noise emissions in the test area. In addition to this smooth air flow, soundproofing materials have been added to the air conditioning compartment outlet to further reduce noise emissions.

- **Cycle time defrost system**

  The standard equipped defrost system can automatically remove frost from the evaporator when operating in the frosting range by simply setting the time via the cycle timer on the instrumentation.

- **Frost-free expansion (option) (Patent pending)**

  Through the development of a low-temperature regenerative dehumidification system, the entire temperature & humidity control range is now frost-free and continuous operation time has been increased. The low humidity side control range has also been expanded. Power consumption has yet been reduced thanks to this system.

**Options**

**Paperless recorder**
Records the temperature of each section such as the temperature inside the chamber.
The data can be transferred by USB.
Data saving cycle: 5 sec.
External recording media:
- CF memory card port (Includes a 256MB CF card)
- USB memory port

Languages: Can be switched between English/Japanese

**Temperature type**
Temperature range: –50 to +100°C
–100 to +100°C
–50 to +150°C
–100 to +200°C

Number of inputs: Temperature 1
(5 more channels can be turned OFF)

**Temperature and humidity type**
Temperature range: –50 to +100°C
–100 to +100°C
–50 to +150°C
–100 to +150°C

Humidity range: 0 to 100%rh

Number of inputs: Temperature 1/
Humidity 1
(4 more channels can be turned OFF)

**Recorder (digital)**

**Recorder output terminal**
This terminal outputs the temperature and relative humidity in the test area.

**Humidity sensor (for temperature & humidity chambers only)**
Eliminates the need to change wicks and can accommodate a range of measurements impossible with a dry bulb sensor, including low humidity ranges.

**Thermocouple**
Used for arbitrary temperature measurement points inside the temperature (humidity) chamber or measuring the specimen temperature.

**Interior plug socket**
To supply power inside the chamber.
We provide two types of sockets according to use.

**Time signal terminal**
Adds additional terminals to the standard time signal terminals.

**Remote control function**
Test conditions can be changed and operation can be started or stopped from your PC over an Ethernet connection.
(Web browser)

**Interface**
Communication port to connect the chamber to a PC.
- RS-485
- RS-232C
- GPIB

**Communication cables**
- RS-485 5 m / 10 m / 30 m
- RS-232C 1.5 m / 3 m / 6 m
- GPIB 2 m / 4 m

**Additional cable port**
Provided addition/replacement of the standard cable port (50 mm)
- ø25 mm
- ø50 mm
- ø100 mm
- ø150 mm
Options

Enlarged viewing window

The standard window (W180×H289 mm) can be changed to a larger type (W440×H295 mm). Tempered heat-resistant glass with defogging heater.

Large viewing window

Viewing window (installed on chamber wall)

Two viewing windows are available:
• Small (W350 × H250 mm)
• Large (W600 × H400 mm)
Heatproof reinforced glass with heat generator incorporated.

Hand-in ports (with viewing window W350 × H 250 mm)

Inner diameter: 150 mm (1 pair).
Useful when handling specimens in the chamber from outside.

Chamber lamp

• LED (adds the same as the standard accessory)
• Fluorescent lamp, ON when room temperature is +5°C to +40°C
• Incandescent lamp

Double swing door

The standard single door (W850 × H1800 mm) can be changed for a double swing door (W1400 × H1800 mm).

Floor reinforcement

Distributes the concentrated load that occurs when specimens are carried into the chamber on a trolley, preventing distortions and dents in the floor. Additional frames to support the floor panels also enhance distributed load resistance.

Additional door

Two types are available: single-swing and double-swing doors. Both come with a viewing window (W180 × H289 mm).

Protective flooring (rubber type)

Prevents operators from slipping and prevents damage and dents.

Entrance curtain

Prevents atmospheric disturbance of temp. and humid. within the chamber when opening and closing the door.

Full-ceiling air duct

Lowers and stabilize air circulation speed to protect specimen.

Preparation room

Minimizes atmospheric disturbance of temperature and humidity when opening and closing the door. Also used as a measurement room for specimens.

Insertion ramp

This ramp is used to move heavy specimens into the chamber. The ramp is available in a removable type and a lever type.

Insertion ramp (lever type)
OPTIONS

Frost-free expansion (temperature & humidity chamber only)
Expands the temperature and humidity control range on the low temperature side and increases continuous operation time by preventing frost formation.

Airflow adjuster
Used when tests require low airflow velocity or a constant velocity.
Setting value range: 4 levels

Low humidity equipment (for temperature and humidity chambers only)
Expands the low-humidity range at low temperatures by using a dry-bulb dehumidifier.

Refrigerator for heat load
Refrigerators can be added to allow heat generation from the specimen during operation.

Auxiliary humidifier (for temperature & humidity chambers only)
Effective for heat load generation and high humidity specification. Pure water required.

Air-cooled inverter chiller system
Supplies cooling water to water-cooled equipment. The system features a sealed circuit that can reduce the need to clean pipes.
Water supply temperature 20 to 25°C

Water purifier (for temperature & humidity chambers only)
Connects to the steam humidifier and optional auxiliary humidifiers. Improves the reliability of measurements over long periods of time and extends the life of the humidifiers.
- Reverse osmosis membrane water purifier
- Ion-exchange water purifier

Flow switch (for water-cooled models only)
This safety switch for refrigeration unit activates when the cooling water level becomes too low or cut off, and shuts down the equipment.

Exhaust air duct (for air-cooled type)
Exhausts hot air out of the refrigeration system. Installed on the upper part of the machinery compartment.

Operation Manual
- DVD
- Booklet

Safety precautions
- Do not use specimens which are explosive or inflammable, or which contain such substances.
  To do so could be hazardous, as this may lead to fire or explosion.
- Do not place corrosive materials in the chamber. If corrosive substances or liquid is used, the life of the unit may be significantly shortened specifically because of the corrosion of stainless steel, resin and silicone materials.
- Do not place life forms or substances that exceed allowable heat generation.
- Be sure to read the operation manual before operation.

Please contact us for non-standard specification.
